Question 1: Who are your team members?

Name 1: Zihan Chen

Name 2: Lukas Donnelly

Name 3: Lingyi Zhu

Question 2: What are you trying to do? (problem or topic) Describe in a couple sentences

We want to investigate how users retention differs between monthly and annually subscription plans, and identify the factors associated with retention, such as frequency, subscription length, or user engagement.

Question 3: Why is this important? Short summary (4-10 sentences) of who cares about this problem, what impact it has, what implications better solutions might have.

Understanding user retention is important for businesses because keeping existing customers is essential for long-term growth and profitability. By identifying the factors that influence users to renew or cancel their subscriptions, we can help companies better understand customers' needs and preferences. Our research can also reveal whether monthly or annual subscription plans are associated with retention rates. These insights could help businesses design more suitable subscription plans, improve customer satisfaction, and reduce customer churn. Customers can enjoy a more convenient and valuable experience, while companies can build stronger customer relationships and achieve more sustainable growth. Ultimately, both customers and businesses can benefit from better subscription strategies.

Question 4: What kind of data/dataset(s) are you interested in working with? You do not need to find a dataset yet. Briefly describe the type of data or datasets you plan to look for.

We plan to look for datasets containing subscription information, such as monthly and annual plans, subscription duration, renewal and cancellation status, and user engagement. Since real user-level subscription data is often confidential and difficult to access, we have found a simulated dataset that includes both monthly and annual subscriptions. We will continue exploring other real-world or simulated datasets that better fit our research question.
